

# Optically Immersed 5.3 $\mu\text{m}$ LED in heat-sink optimized housing

# LED53Su, LED53Sr

Peak wavelength $\lambda_{\max}$	$\mu\text{m}$	5.35
Pulse power $P_{\text{pulsed}}$	mW	Drive current 1 A, 2 % duty cycle
Quasi-CW power $P_{\text{QCW}}$	mW	Drive current 0.4 A, 50% duty cycle
CW power $P_{\text{CW}}$	mW	Drive current 0.2 A

Code	Emission size, mm	Lens material	Far-field pattern FWHM, deg.	Optical axis deviation, deg.	Optical power deviation, %	Operation conditions, $^{\circ}\text{C}$	Lifetime, hrs	Polarity
LED53Su/Sr	$\varnothing$ 3.2	Si	~15	$\leq$ 5	$\pm$ 25	-25÷+60	>80 000	Red wire – positive, Black wire – negative

Product view		
	Growth of narrow gap semiconductor alloys onto $n^{+}$ -InAs substrate; Flip-chip design of LEDs; Optical coupling through the use of chalcogenide glasses and Si lenses with antireflection coating	3-fold increased LED output power; Beam collimation within ~15 deg; Low serial resistance; Small on-off time (tenths of ns); Low power consumption ( $\leq$ 0.1 W)
Features	Emission beam divergence is small and thus we recommend adjusting LED position regarding to the detector system before final evaluation/use of the devices. We recommend if possible using low duty cycle mode of operation with $I < 0.5 \times I_{\max}$ so that higher efficiency and long term stability of a LED are achieved. <b>Data are valid for 22°C and LED attached to a heatsink.</b> Heatsink is important for LED operation especially in the CW mode.	

Product specifications are subject to change without prior notice due to improvements or other reasons. Updated 14.10.11
